L14 ANSWER 1 OF 10 CAPLUS COPYRIGHT 2004 ACS on STN

AB The thermal polymerization of dihydrohyroxy-exo-dicyclopentadienyl and tetrahydrohydroxy-exo-dicyclopentadienyl maleates was carried out at 220° in the absence of any initiator to investigate quant. the mechanism of polymer formation. The characteristics of the thermal polymerization were discussed mainly with regarded to the average mol. weight, mol.-weight distribution, and 1H-NMR spectra of the products before and after hydrolysis. It seems that the presence of a double bond within the skeleton of dicyclopentadiene is necessary for the thermal polymerization to occur. This thermal polymerization is initiated by both radical chain reaction of the isomerized fumaroyl double bond and ene-reaction of the fumaroyl double bond with the allylic double bond in the cyclopentene ring. The radical chain reaction terminated rapidly at a d.p. <6. On the other hand, the ene-reaction trends to progress with increasing mol. weight of the polymer produced.

AB Unsatd. **polyesters** containing ≥20 mol % (based on total acid components) tricyclodecenyl maleate and(or) tricyclodecenyl fumarate and 15-80 mol % isophthalic acid or terephthalic acid are prepared after relatively short polymerization times. Thus, a mixture of Cydecanol maleate monoester 1.042, maleic anhydride 274, isophthalic acid 344, and propylene glycol 585 parts was heated in the presence of 0.01% hydroquinone to 210° in 5 h and kept there for 6 h to give copolymer (I) [**79104-51-1**] with acid number 29. A composition of I 74, styrene 26, Co naphthenate 0.5, 55% MeCOEt peroxide 1.0 part at 25° had gelation time 8 min, and the cured product (15 h at 50°) had flexural strength 17 kg/mm2, and water absorption 1.2%. Isophthalic acid-maleic anhydride-propylene glycol copolymer having similar acid number was prepared after 23 h of heating.

I

AB A maleate monoester, e.g., I [**29725-36-8**], prepared from dicyclopentadiene [77-73-6] or Cydecanol [133-21-1] and maleic anhydride (II) [108-31-6] or maleic acid [110-16-7], was esterified with a polyhydric alc. and, optionally, unsatd. fatty acids, and mixed with a crosslinking monomer, e.g.styrene [100-42-5], to prepare hardenable resins useful in the preparation of laminates, moldings, and coatings with good toughness, gloss, solvent resistance, and antiblocking properties. Thus, 784 parts II and 1200 parts Cydecanol were esterified at 140° to prepare I. A mixture of 124 parts HOCH2CH2OH [107-21-1] and 148 parts phthalic anhydride was polymerized at 210° to give a resin with acid number 9.1, which was mixed with 496 parts I, 0.01% hydroquinone, and 3% xylene, and the solution heated at 210° for 7 h to give an esterified oligomer with OH number 23.1. A mixture of 75% oligomer and 25% styrene had Gardner viscosity 2.8 s and was used with 30% glass fibers to prepare a hardened laminate with 0.07% water absorption during 24 h at 25°, 72 h resistance to water at 98°, and flexural strength 8.9 kg/mm2.
